

# Chess with voice recognition vision

---

FOR people with visual disabilities or people that just don't feel like using a cursor to move chess pieces WHO need a way to do so. THE chess with voice recognition is an implementation of a chess THAT allows the user to play chess without the need for user interaction. UNLIKE other chess platforms OUR PRODUCT allows voice recognition, is open source and free to use which we feel that is very important, especially in today's age where you can't even read a news article without hitting 5 paywalls and 12 advertisements.
